

# WEB PHISHING DETECTION

## PROBLEM STATEMENTS

1. The user or customer needs a way to *verify the domain name* so that they can make sure they are using the original service only.
2. The business needs a way to monitor the users and *check their activity* so that they do not end up sending bad requests.
3. The customer and the business needs an extension attached to the browser in order to inform them about the *authenticity of the website* they are viewing at the moment.
4. The business server needs a way to analyze the users so that they *do not bypass any authorization procedures*. This can help them identify the fishy requests and their origin.
5. The platform needs a way to monitor recent site checks so that they can be reused or *update their authenticity* of using them.
